

# Security Risks for E-Commerce Sites

According to a report by the B2C eCommerce Observatory of Politecnico di Milano, the Italian e-commerce sector is growing but has not yet reached its full potential.

One factor slowing its expansion is customer distrust of transaction security. The concern is justified: an unprotected e-commerce site is exposed to concrete risks.

## Compromised E-Commerce

What happens if the site is hit by a cyberattack?

- Search engines, such as Google, can remove the infected site or temporarily

downgrade it.

- Browsers such as Firefox or Chrome can block the site with warning screens.
- The user's antivirus may show danger messages during the visit.
- Fake copies of the site may be created for phishing and data theft.

In the event of an attack, the damage is not only reputational: it ranges from theft of personal data and email addresses to the appropriation of credit card numbers, which should never be stored unless strictly necessary.

How ready are you to protect your business from these risks?

## Want to know if your company is truly protected?

EasyAudit checks applications, infrastructure and e-commerce platforms with a clear, concrete audit designed to turn technical risks into simple decisions.
